Biometric Access Control Solutions

Typical Installation Scenarios

Employee Entrances w/Card Access

When the SpeedFACE reader is installed at employee entrances and connected to electronic access control system, it will provide a secondary means of verification. Employees will scan their door access card and then allow the SpeedFACE reader to verify compliance with body temperature and/or face mask policies. Once verified, the reader will pass the employees card data to the access control system for door unlocking.

Visitor Entrances w/Lock Control

When the SpeedFACE reader is installed at visitor entrances and connected to an electronic door lock, it will provide automated visitor entry once the configured body-temperature and/or face mask policies have been satisfied. This reduces the staffing needs for maintaining compliance and provides peace of mind to visitors and customers.

Secure Entrances w/Receptionist

When the SpeedFACE reader is installed at a secured office entrance, visitors can intercom the receptionist for access. If entry is authorized, the receptionist may remotely unlock the door once the SpeedFACE reader has confirmed compliance with the body-temperature and face mask policies.

Biometric Access Only

The SpeedFACE reader may also be used for facial and/or palm identification purposes only. This allows employees to quickly access secured areas without the need for physical credentials such as keyfobs or access control cards. Face/Palm templates may be managed directly at the SpeedFACE reader or invited users may enroll themselves via their smartphone when the optional software interface is purchased.
